ABSTRACT A taxonomic study of Korean Phaneropterinae (Orthoptera, Tettigoniidae) was presented. Eight species are recognized, one of which is *Psyrana japonica* (Shiraki) reported for the first time in Korea. A key, distributional data and biological notes are provided.

Key words : Taxonomy, Orthoptera, Tettigoniidae, Phaneropterinae, Korea

INTRODUCTION

As a member of Tettigoniidae (Orthoptera), subfamily Phaneropterinae has been recognized nearly 2,060 species in 85 genera throughout the world (Naskrecki and Otte, 1999). The early faunistic studies of Korea were presented by Mori (1933), Cho (1959) and Lee (1990) as six species each in part of Orthoptera, Kwon and Huh (1994) summarized it as seven species. However, a comprehensive taxonomic study of Korean Phaneropterinae was not provided until now.

In this paper, we report eight species in seven genera from Korean fauna including a new record of *Psyrana japonica* (Shiraki). A key to each species, figures for identification (stridulatory apparatus and terminalia of males), distributional data and biological notes are presented.

SYSTEMATIC ACCOUNT

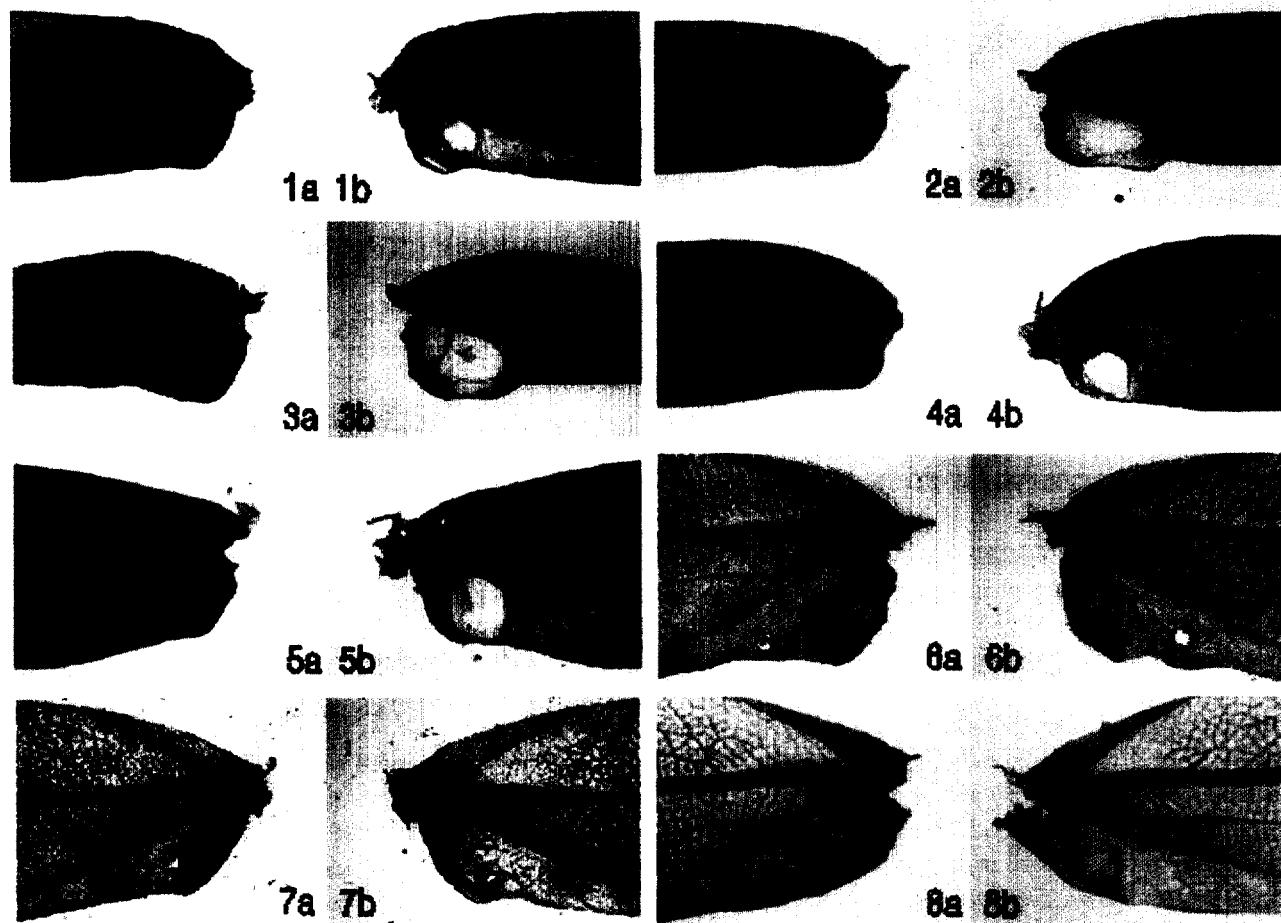

Subfamily Phaneropterinae Burmeister

Type genus: Phaneroptera Audinet-Serville.

Key to Korean Species and Genera of Phaneropterinae

1. Auditory structure of fore tibiae identical each sides. Male subgenital plate without styli. 2
- Auditory structure of fore tibiae slit shaped with conchate fold internally, oval shaped externally. Male subgenital plate with styli. 6
2. Base of fore femora with weak sinus. Auditory structure of fore tibiae slit shaped each sides with conchate fold. (Genus *Elimaea*) *E. fallax* Bey-Bienko
- Base of fore femora straight. Auditory structure of fore tibiae opened as oval shaped each sides. 3
3. Pronotum with strong humeral sinus. Tegmina with dark small spots developed. Genus *Phaneroptera* 4
- Pronotum with weak humeral sinus. Tegmina without dark spots developed. 5
4. Antennae pale or concolor with body. Eyes slightly convex, not more than hemispherical. *P. falcata* Poda
- Antennae black with regular whitish annulation. Eyes strongly convex, more than hemispherical. *P. nigroantennata* Brunner von Wattenwyl
5. Hind wings longer than tegmina in both sexes. Male subgenital plate bifurcate deeply. (Genus *Ducetia*) *D. japonica* Thunberg

- Hind wings longer than tegmina only in male. Male subgenital plate not bifurcate, hemicylindrical. (**Genus Kuwayamaea**)
- K. sapporensis* Matsumura et Shiraki**
- 6. Male last abdominal tergite simple, cerci fully exposed. Female ovipositor as long as more than 3 times of mid width. (**Genus Psyrana**) *P. japonica* Shiraki
- Male last abdominal tergite largely developed, cerci covered. Female ovipositor as long as less than 2.5 times of mid width. 7
- 7. Male last abdominal tergite bilobate. Female ovipositor serrated along dorsal margin with apex weakly truncated. (**Genus Holochlora**) *H. japonica* Brunner von Wattenwyl
- Male last abdominal tergite trilobate. Female ovipositor serrated only apex with strong truncation. (**Genus Sinochlora**) *S. longifissa* Matsumura et Shiraki

(**Genus Sinochlora**) *S. longifissa*
Matsumura et Shiraki

Genus *Elimaea* Stål

Type species: *Phaneroptera subcarinata* Stål.

Biological note. Female stridulation with weak sound is observed in this species as studied on some Phaneropterid (Heller and Helversen, 1986).

Distribution. Korea, China, Russia.

Remarks. In Korea, the name *Elimaea grandis* (Matsumura et Shiraki) from Taiwan mostly had been used for the species and *E. fallax* Bey-Bienko was reported recently by Liu and Jin (1993). All Korean samples were similar to this, based on geographical range, using the name *E. fallax* is reasonable. However, 1) measurements of Korean specimens are larger than them of *E. fallax* in general, while near to *E. grandis* 2) Bey-Bienko (1951) did not recognize the differences with *E. grandis* because the species belonged to the genus *Phaneroptera* at that time. Thus, it is need to clarify the difference with the types.
